5 Reference is made to commonly assigned, co-pending U.S. Patent Applications Serial Number: 10/614,378 by Foster et al., filed of even date herewith (~~Docket 85994~~), entitled "Slipping Layer Containing Wax Mixture For Dye-Donor Element used in Thermal Dye Transfer" and Serial Number: 10/614,379 by Foster et al., filed of even date herewith (Docket 10 ~~86697~~), entitled "Slipping Layer For Dye-Donor Element used in Thermal Dye Transfer."

FIELD OF THE INVENTION

15 This invention relates to dye donor elements used in thermal dye transfer, and more particularly to the use of a blend of a branched olefinic polymer with at least one other wax in the slipping layer on the back side thereof to improve the performance of the donor element before and during the printing operation.

BACKGROUND OF THE INVENTION

20 In recent years, thermal transfer systems have been developed to obtain prints from pictures which have been generated electronically from a color camera. According to one way of obtaining such prints, an electronic picture is first subjected to color separation by color filters. The respective color-separated images are then converted into electrical signals. These signals are then operated on to produce cyan, magenta and yellow electrical signals. These signals are then 25 transmitted to a thermal printer. To obtain the print, a cyan, magenta or yellow dye-donor element is placed face-to-face with a dye-receiving element. The two are then inserted between a thermal printing head and a platen roller. A line-type thermal printing head is used to apply heat from the back of the dye-donor sheet. The thermal printing head has many heating elements and is heated up 30 sequentially in response to the cyan, magenta and yellow signals. The process is then repeated for the other two colors. A color hard copy is thus obtained which
